

Project Documentation – Automated Employee Onboarding & Offboarding

1. Introduction

Project Title: Automated Employee Onboarding & Offboarding

Project Contributors: Nikhil Isukapatla and Pachimalla Vishala

Nikhil Isukapatla – Role: ServiceNow Developer, Designer, and Workflow Developer

Nikhil Isukapatla – Contribution: Designed, developed, configured, tested, and demonstrated the ServiceNow application.

Pachimalla Vishala – Role: Tester and Documentation Contributor

Pachimalla Vishala – Contribution: Assisted with application testing, validation of project functionality, and preparation of project documentation.

2. Project Overview

Purpose: The purpose of this project is to automate employee onboarding and offboarding activities using ServiceNow. It replaces manual coordination between HR, Managers, IT, Facilities, and Security teams with centralized records, automated approvals, departmental tasks, and status tracking.

Features: Employee onboarding requests; employee offboarding requests; centralized employee lifecycle records; Manager, IT, and HR approvals; automated departmental task creation; request status tracking; role-based access; Business Rules for data consistency.

3. Architecture

Frontend: ServiceNow forms and interfaces are used to create and track onboarding and offboarding requests.

Backend: ServiceNow Flow Designer, approval actions, Business Rules, roles, and access controls process requests and coordinate departmental work.

Database: Custom ServiceNow tables store employee details, request information, dates, departments, approval statuses, and overall request status.

4. Setup Instructions

Prerequisites: ServiceNow instance, internet connection, and a supported web browser such as Chrome or Edge.

Installation / Configuration: Log in to the ServiceNow instance; create the application scope; create custom tables and fields; configure forms; create required users, groups, and roles; build Flow Designer automations; configure approval stages and departmental tasks; add Business Rules and access controls; test end-to-end scenarios.

5. Application Components

User Interface: Forms used by authorized users to submit and review employee lifecycle requests.

Data Layer: Custom tables and fields for employee and request information.

Automation Layer: Flow Designer flows for approvals, task creation, and status updates.

Security Layer: Roles and access controls for HR, Managers, IT, Facilities, and Security teams.

6. Running the Application

Onboarding: Create a new onboarding request, enter employee details, submit the record, verify that the request moves to In Progress, complete the approval stages, and verify departmental tasks and status updates.

Offboarding: Create an offboarding request with employee and last-working-date details, run the workflow, complete access removal and clearance tasks, and verify the final request status.

7. Workflow Operations

Key Operations: Create lifecycle request records; update request and approval statuses; route approvals; create departmental tasks; maintain request history; complete the lifecycle process.

8. Authentication and Access

Security: ServiceNow authentication is used for secure login. Role-based access is configured so participating teams can access the records and activities relevant to their responsibilities.

9. User Interface

Interface: The application uses ServiceNow forms and lists for request submission, approval tracking, task handling, and lifecycle status visibility.

10. Testing

Tests Performed: Verified request creation; checked the In Progress status update; tested Manager, IT, and HR approval stages; verified Flow Designer triggers and conditions; checked data pill mappings; tested departmental task creation; validated end-to-end onboarding and offboarding processing.

12. Known Issues

Limitations: The project depends on ServiceNow instance availability and correct user, group, role, and workflow configuration. Additional UI customization may be required for production use.

13. Future Enhancements

Enhancements: Email notifications; employee self-service portal; richer dashboards and reports; integration with identity and asset management systems; mobile access; advanced SLA tracking.
